Text Summarization is one of those applications of Natural Language Processing (NLP) which is bound to have a huge impact on our lives. With growing digital media and ever growing publishing – who has the time to go through entire articles / documents / books to decide whether they are useful or not? Thankfully – this technology is already here.

Have you come across the mobile app **inshorts**? It's an innovative news app that converts news articles into a 60-word summary. And that is exactly what we are going to learn in this article — **Automatic Text Summarization**.

Stay informed in 60 words.

We understand you don't have time to go through long news articles everyday. So we cut the clutter and deliver them, in 60-word shorts. Short news for the mobile generation.

Automatic Text Summarization is one of the most challenging and interesting problems in the field of Natural Language Processing (NLP). It is a process of generating a concise and meaningful summary of text from multiple text resources such as books, news articles, blog posts, research papers, emails, and tweets.

The demand for automatic text summarization systems is spiking these days thanks to the availability of large amounts of textual data.

Through this article, we will explore the realms of text summarization. We will understand how the TextRank algorithm works, and will also implement it in Python. Strap in, this is going to be a fun ride!

Text Summarization Approaches

Automatic Text Summarization gained attention as early as the 1950's. A research paper (<http://courses.ischool.berkeley.edu/i256/f06/papers/luhn58.pdf>), published by Hans Peter Luhn in the late 1950s, titled "The automatic creation of literature abstracts", used features such as word frequency and phrase frequency to extract important sentences from the text for summarization purposes.

Another important research (<http://courses.ischool.berkeley.edu/i256/f06/papers/edmonson69.pdf>), done by Harold P Edmundson in the late 1960's, used methods like the presence of cue words, words used in the title appearing in the text, and the location of sentences, to extract significant sentences for text summarization. Since then, many important and exciting studies have been published to address the challenge of automatic text summarization.

Text summarization can broadly be divided into two categories — **Extractive Summarization** and **Abstractive Summarization**.

1. **Extractive Summarization:** These methods rely on extracting several parts, such as phrases and sentences, from a piece of text and stack them together to create a summary. Therefore, identifying the right sentences for summarization is of utmost importance in an extractive method.
2. **Abstractive Summarization:** These methods use advanced NLP techniques to generate an entirely new summary. Some parts of this summary may not even appear in the original text.

In this article, we will be focusing on the **extractive summarization** technique.

Understanding the TextRank Algorithm

Download Resource
Subscribe!

Before getting started with the TextRank algorithm, there's another algorithm which we should become familiar with – the PageRank algorithm. In fact, this actually inspired TextRank! **PageRank is used primarily for ranking web pages in online search results.** Let's quickly understand the basics of this algorithm with the help of an example.

PageRank Algorithm

Suppose we have 4 web pages — w1, w2, w3, and w4. These pages contain links pointing to one another. Some pages might have no link – these are called dangling pages.

| webpage | links |
|---------|----------|
| w1 | [w4, w2] |
| w2 | [w3, w1] |
| w3 | [] |
| w4 | [w1] |

- Web page w1 has links directing to w2 and w4
- w2 has links for w3 and w1
- w4 has links only for the web page w1

Download Resource
Subscribe!

- w3 has no links and hence it will be called a dangling page

In order to rank these pages, we would have to compute a score called the **PageRank score**. This score is the probability of a user visiting that page.

To capture the probabilities of users navigating from one page to another, we will create a square **matrix M**, having n rows and n columns, where n is the number of web pages.

M =

| | w1 | w2 | w3 | w4 |
|----|----|----|----|----|
| w1 | | | | |
| w2 | | | | |
| w3 | | | | |
| w4 | | | | |

Each element of this matrix denotes the probability of a user transitioning from one web page to another. For example, the highlighted cell below contains the probability of transition from w1 to w2.

M =

| | w1 | w2 | w3 | w4 |
|----|----|----|----|----|
| w1 | | | | |
| w2 | | | | |
| w3 | | | | |
| w4 | | | | |

P(w1 to w2)

The initialization of the probabilities is explained in the steps below:

1. Probability of going from page i to j , i.e., $M[i][j]$, is initialized with **$1/(\text{number of unique links in web page } w_i)$**
2. If there is no link between the page i and j , then the probability will be initialized with **0**
3. If a user has landed on a dangling page, then it is assumed that he is equally likely to transition to any page. Hence, $M[i][j]$ will be initialized with **$1/(\text{number of web pages})$**

Hence, in our case, the matrix M will be initialized as follows:

M =

| | w1 | w2 | w3 | w4 |
|----|------|------|------|------|
| w1 | 0 | 0.5 | 0 | 0.5 |
| w2 | 0.5 | 0 | 0.5 | 0 |
| w3 | 0.25 | 0.25 | 0.25 | 0.25 |
| w4 | 1 | 0 | 0 | 0 |

Finally, the values in this matrix will be updated in an iterative fashion to arrive at the web page rankings.

TextRank Algorithm

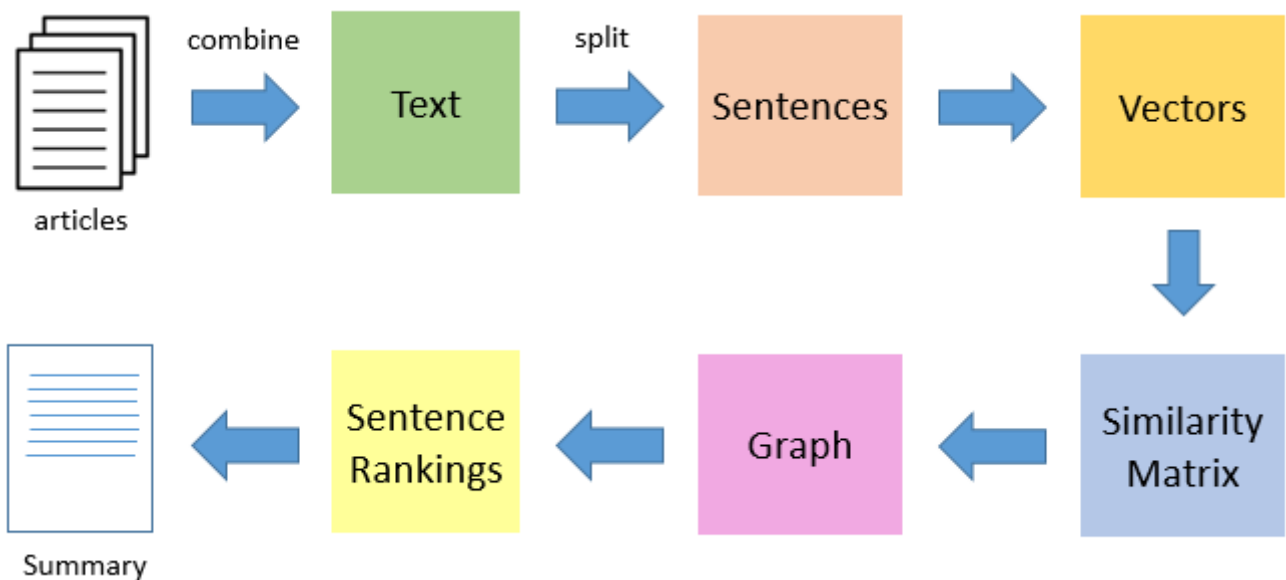

Download Resource
Subscribe!

Let's understand the TextRank algorithm, now that we have a grasp on PageRank. I have listed the similarities between these two algorithms below:

- In place of web pages, we use sentences
- Similarity between any two sentences is used as an equivalent to the web page transition probability
- The similarity scores are stored in a square matrix, similar to the matrix M used for PageRank

TextRank is an extractive and unsupervised text summarization technique. Let's take a look at the flow of the TextRank algorithm that we will be following:

- The first step would be to concatenate all the text contained in the articles
- Then split the text into individual sentences
- In the next step, we will find vector representation (word embeddings) for each and every sentence
- Similarities between sentence vectors are then calculated and stored in a matrix
- The similarity matrix is then converted into a graph, with sentences as vertices and similarity scores as edges, for sentence rank calculation
- Finally, a certain number of top-ranked sentences form the final summary

So, without further ado, let's fire up our Jupyter Notebooks and start coding!

Note: If you want to learn more about Graph Theory, then I'd recommend checking out this [article](https://www.analyticsvidhya.com/blog/2018/09/introduction-graph-theory-applications-python/) (<https://www.analyticsvidhya.com/blog/2018/09/introduction-graph-theory-applications-python/>).

Understanding the Problem Statement

Download Resource
Subscribe!

Being a major tennis buff, I always try to keep myself updated with what's happening in the sport by religiously going through as many online tennis updates as possible. However, this has proven to be a rather difficult job! There are way too many resources and time is a constraint.

Therefore, I decided to design a system that could prepare a bullet-point summary for me by scanning through multiple articles. How to go about doing this? That's what I'll show you in this tutorial. We will apply the TextRank algorithm on a dataset of scraped articles with the aim of creating a nice and concise summary.

Wendie Hingray (left) returns a shot against Lucie Kuznetsov in the first of the 2019 Fed Cup at the Stade de France on Oct. 28, 2018. She reached the final after losing the first set to win the match 3-2. (Photo: AP Photo/Chris Wedel)

PUBLISHED: OCT 28, 2018, 10:10 PM EDT | UPDATED: OCT 29, 2018, 7:59 AM

in China

GAPORIE - Elena Dementieva of Ukraine won the biggest title of her career on Sunday (Oct. 28) defeating Simona Halep 3-6, 6-2, 6-2 to win the BNP Paribas WTA Finals Singapore. The match was the first time the world No. 7 has beaten No. 6 Halep on a hard court.

"It's definitely a very special moment for me. I know I played great tennis this week and I'm happy to share this moment with you guys. Definitely, Singapore is going to stay for a very long time in my mind," Dementieva said in an on-court interview.

Wendie Hingray (left) returns a shot against Lucie Kuznetsov in the first of the 2019 Fed Cup at the Stade de France on Oct. 28, 2018. She reached the final after losing the first set to win the match 3-2. (Photo: AP Photo/Chris Wedel)

lost a month of no competition, the women's tennis team returned to the courts this week for the Alabama Classic.

It was Oct. 11-15, IU Coach Ramiro Azcoz sent junior Caitlin Bernard and seniors Natalie and Madison Appel to Chattanooga, Tennessee, to compete in the Intercollegiate Tennis Association Ohio Valley Regional Championships. But this past weekend was the first time the full team has competed in the Hoosier Classic on Sept. 28-30.

In a two-day tournament, Appel and Whalen highlighted the singles competition by each going to three final tournaments. Appel and Whalen, the team's only seniors, have gone a combined 1-1 in play.

"If he does not play, the stadium is half empty. That's why I am worried when I think about the end of Federer and Nadal's career."

Rafael Nadal and Roger Federer are nearing retirement. (Image: GETTY)

RELATED ARTICLES

Paris Masters results LIVE: Federer, Nadal and Djokovic all in action

Marin Cilic makes Federer, Nadal and Djokovic seduction

"So tennis needs a new generation to win Grand Slams while the Big Four are still playing."

"Otherwise, [Alexander] Zverev and Co. won't have credibility."

Amnesty International has urged Rafael Nadal and Novak Djokovic not to play in the event. (Getty Images)

PARIS (AP) — **Roger Federer** turned down an invitation to play in a planned exhibition match in Saudi Arabia in December which his rivals Novak Djokovic and Rafael Nadal have committed to play in.

Saudi Arabia is under growing pressure from the international community following the killing of Saudi writer Jamal Khashoggi after he entered Saudi Arabia's consulate in Istanbul on Oct. 2. He was a Washington Post columnist who had written critically of Saudi Arabia's crown prince.

Tennis stars Djokovic and Nadal have expressed doubt as to whether they will play an exhibition match at the King Abdullah Sports City in Jeddah on Dec. 22, but they have not withdrawn. Both players have said the invitations were made at least one year ago.

Wendie Hingray (left) returns a shot against Lucie Kuznetsov in the first of the 2019 Fed Cup at the US Cellular Center on Feb. 11, 2018 in Asheville, NC. (Photo: Richard Shein/Getty Images)

ASHEVILLE, NC (WSPA) — Fed Cup tennis is returning to Asheville for the second consecutive year according to the USTA.

The US Cellular Center in Asheville will host the United States' Fed Cup First Round tie against Australia in February 2019.

The matches will take place on February 9 and 10.

"We couldn't be happier to be bringing Fed Cup back to Asheville," said USTA President Katrina Adams. "Everything about the First Round tie vs. the Netherlands earlier this year was incredible. It was our local business partners to the staff at the U.S. Cellular Center to the local volunteers and the enthusiastic community that cheered us on to victory. Asheville made for a perfect Fed Cup host, and we look forward to coming back."

As the matches approach, cheering fans are already getting in the spirit of the event.

But the partisan crowd appeared to not know what had happened at first and started booing before delivering a slow-hand clap.

They then applauded as the chair umpire returned to his seat.

The man was eventually walked away from his seat by medical staff.

Novak Djokovic was composed as he cruised through the Paris Masters second round. (Image: GETTY)

Djokovic ran out a 7-5 6-1 winner over Souse to progress to the third round in the French capital.

He will play world No. 52 Denis Donskoy, with potential quarter-finals clash with Marin Cilic in the horizon.

Novak Djokovic is hoping to win the Paris Masters for the fifth time in his career.

Please note that this is essentially a single-domain-multiple-documents summarization task, i.e., we will take multiple articles as input and generate a single bullet-point summary. Multi-domain text summarization is not covered in this article, but feel free to try that out at your end.

You can download the dataset we'll be using from [here \(https://s3-ap-south-1.amazonaws.com/av-blog-media/wp-content/uploads/2018/10/tennis_articles_v4.csv\)](https://s3-ap-south-1.amazonaws.com/av-blog-media/wp-content/uploads/2018/10/tennis_articles_v4.csv).

Implementation of the TextRank Algorithm

So, without any further ado, fire up your Jupyter Notebooks and let's implement what we've learned so far.

Import Required Libraries

First, import the libraries we'll be leveraging for this challenge.

```
import numpy as np
import pandas as pd
import nltk
nltk.download('punkt') # one time execution
import re
```

Read the Data

Now let's read our dataset. I have provided the link to download the data in the previous section (in case you missed it).

```
df = pd.read_csv("tennis_articles_v4.csv")
```

Inspect the Data

Let's take a quick glance at the data.

```
df.head()
```

| | article_id | article_text | source |
|---|------------|---|---|
| 0 | 1 | Maria Sharapova has basically no friends as te... | https://www.tennisworldusa.org/tennis/news/Mar... |
| 1 | 2 | BASEL, Switzerland (AP), Roger Federer advance... | http://www.tennis.com/pro-game/2018/10/copil-s... |
| 2 | 3 | Roger Federer has revealed that organisers of ... | https://scroll.in/field/899938/tennis-roger-fe... |
| 3 | 4 | Kei Nishikori will try to end his long losing ... | http://www.tennis.com/pro-game/2018/10/nishiko... |
| 4 | 5 | Federer, 37, first broke through on tour over ... | https://www.express.co.uk/sport/tennis/1036101... |

Download Resource
Subscribe!

We have 3 columns in our dataset — 'article_id', 'article_text', and 'source'. We are most interested in the 'article_text' column as it contains the text of the articles. Let's print some of the values of the variable just to see what they look like.

```
df['article_text'][0]
```

Output:

```
"Maria Sharapova has basically no friends as tennis players on the WTA Tour. The Russian p
layer
has no problems in openly speaking about it and in a recent interview she said: 'I don't r
eally
hide any feelings too much. I think everyone knows this is my job here. When I'm on the co
urts
or when I'm on the court playing, I'm a competitor and I want to beat every single person
whether
they're in the locker room or across the net..."
```

```
df['article_text'][1]
```

```
BASEL, Switzerland (AP), Roger Federer advanced to the 14th Swiss Indoors final of his car
eer by beating
seventh-seeded Daniil Medvedev 6-1, 6-4 on Saturday. Seeking a ninth title at his hometown
event, and a 99th
overall, Federer will play 93th-ranked Marius Copil on Sunday. Federer dominated the 20th-
ranked Medvedev and had
his first match-point chance to break serve again at 5-1..."
```

```
df['article_text'][2]
```

Download Resource
Subscribe!

```
Roger Federer has revealed that organisers of the re-launched and condensed Davis Cup gave him three days to decide if he would commit to the controversial competition. Speaking at the Swiss Indoors tournament where he will play in Sundays final against Romanian qualifier Marius Copil, the world number three said that given the impossibly short time frame to make a decision, he opted out of any commitment...
```

Now we have 2 options – we can either summarize each article individually, or we can generate a single summary for all the articles. For our purpose, we will go ahead with the latter.

Split Text into Sentences

Now the next step is to break the text into individual sentences. We will use the *sent_tokenize()* function of the *nltk* library to do this.

```
from nltk.tokenize import sent_tokenize
sentences = []
for s in df['article_text']:
    sentences.append(sent_tokenize(s))

sentences = [y for x in sentences for y in x] # flatten list
```

Let's print a few elements of the list *sentences*.

```
sentences[:5]
```

Output:

Download Resource
Subscribe!

```
['Maria Sharapova has basically no friends as tennis players on the WTA Tour.',  
"The Russian player has no problems in openly speaking about it and in a recent  
interview she said: 'I don't really hide any feelings too much.",  
'I think everyone knows this is my job here.',  
"When I'm on the courts or when I'm on the court playing,  
I'm a competitor and I want to beat every single person whether they're in the  
locker room or across the net. So I'm not the one to strike up a conversation about  
the weather and know that in the next few minutes I have to go and try to win a tennis mat  
ch.",  
"I'm a pretty competitive girl."]
```

Download GloVe Word Embeddings

GloVe (<https://nlp.stanford.edu/projects/glove/>) word embeddings are vector representation of words. These word embeddings will be used to create vectors for our sentences. We could have also used the Bag-of-Words or TF-IDF approaches to create features for our sentences, but these methods ignore the order of the words (and the number of features is usually pretty large).

We will be using the pre-trained **Wikipedia 2014 + Gigaword 5** GloVe vectors available [here](https://nlp.stanford.edu/data/glove.6B.zip) (<https://nlp.stanford.edu/data/glove.6B.zip>). *Heads up – the size of these word embeddings is 822 MB.*

```
!wget http://nlp.stanford.edu/data/glove.6B.zip  
!unzip glove*.zip
```

Let's extract the words embeddings or word vectors.

```
# Extract word vectors  
word_embeddings = {}  
f = open('glove.6B.100d.txt', encoding='utf-8')  
for line in f:  
    values = line.split()  
    word = values[0]  
    coefs = np.asarray(values[1:], dtype='float32')  
    word_embeddings[word] = coefs  
f.close()
```

Download Resource
Subscribe!

```
len(word_embeddings)
```

```
400000
```

We now have word vectors for 400,000 different terms stored in the dictionary – ‘word_embeddings’.

Text Preprocessing

It is always a good practice to make your textual data noise-free as much as possible. So, let's do some basic text cleaning.

```
# remove punctuations, numbers and special characters
clean_sentences = pd.Series(sentences).str.replace("[^a-zA-Z]", " ")

# make alphabets lowercase
clean_sentences = [s.lower() for s in clean_sentences]
```

Get rid of the stopwords (commonly used words of a language – is, am, the, of, in, etc.) present in the sentences. If you have not downloaded *nltk-stopwords*, then execute the following line of code:

```
nltk.download('stopwords')
```

Now we can import the stopwords.

```
from nltk.corpus import stopwords
stop_words = stopwords.words('english')
```

Let's define a function to remove these stopwords from our dataset.

```
# function to remove stopwords
def remove_stopwords(sen):
    sen_new = " ".join([i for i in sen if i not in stop_words])
    return sen_new
```

Download Resource
Subscribe!

```
# remove stopwords from the sentences
clean_sentences = [remove_stopwords(r.split()) for r in clean_sentences]
```

We will use *clean_sentences* to create vectors for sentences in our data with the help of the GloVe word vectors.

Vector Representation of Sentences

```
# Extract word vectors
word_embeddings = {}
f = open('glove.6B.100d.txt', encoding='utf-8')
for line in f:
    values = line.split()
    word = values[0]
    coefs = np.asarray(values[1:], dtype='float32')
    word_embeddings[word] = coefs
f.close()
```

Now, let's create vectors for our sentences. We will first fetch vectors (each of size 100 elements) for the constituent words in a sentence and then take mean/average of those vectors to arrive at a consolidated vector for the sentence.

```
sentence_vectors = []
for i in clean_sentences:
    if len(i) != 0:
        v = sum([word_embeddings.get(w, np.zeros((100,))) for w in i.split()])/(len(i.split())
+0.001)
    else:
        v = np.zeros((100,))
    sentence_vectors.append(v)
```

Note: For more text preprocessing best practices, you may check our video course, [Natural Language Processing \(NLP\) using Python \(https://trainings.analyticsvidhya.com/courses/course-v1:AnalyticsVidhya+NLP101+2018_T1/about?utm_source=blog&utm_medium=introduction-text-summarization-textrank-python\)](https://trainings.analyticsvidhya.com/courses/course-v1:AnalyticsVidhya+NLP101+2018_T1/about?utm_source=blog&utm_medium=introduction-text-summarization-textrank-python).

Download Resource
Subscribe!

Similarity Matrix Preparation

The next step is to find similarities between the sentences, and we will use the cosine similarity approach for this challenge. Let's create an empty similarity matrix for this task and populate it with cosine similarities of the sentences.

Let's first define a zero matrix of dimensions ($n * n$). We will initialize this matrix with cosine similarity scores of the sentences. Here, n is the number of sentences.

```
# similarity matrix
sim_mat = np.zeros([len(sentences), len(sentences)])
```

We will use Cosine Similarity to compute the similarity between a pair of sentences.

```
from sklearn.metrics.pairwise import cosine_similarity
```

And initialize the matrix with cosine similarity scores.

```
for i in range(len(sentences)):
    for j in range(len(sentences)):
        if i != j:
            sim_mat[i][j] = cosine_similarity(sentence_vectors[i].reshape(1,100), sentence_vectors[j].reshape(1,100))[0,0]
```

Applying PageRank Algorithm

Before proceeding further, let's convert the similarity matrix *sim_mat* into a graph. The nodes of this graph will represent the sentences and the edges will represent the similarity scores between the sentences. On this graph, we will apply the PageRank algorithm to arrive at the sentence rankings.

```
import networkx as nx

nx_graph = nx.from_numpy_array(sim_mat)
scores = nx.pagerank(nx_graph)
```

Download Resource
Subscribe!

Summary Extraction

Finally, it's time to extract the top N sentences based on their rankings for summary generation.

```
ranked_sentences = sorted(((scores[i],s) for i,s in enumerate(sentences)), reverse=True)
```

```
# Extract top 10 sentences as the summary
for i in range(10):
    print(ranked_sentences[i][1])
```

Download Resource
Subscribe!

When I'm on the courts or when I'm on the court playing, I'm a competitor and I want to be at every single person whether they're in the locker room or across the net. So I'm not the one to strike up a conversation about the weather and know that in the next few minutes I have to go and try to win a tennis match.

Major players feel that a big event in late November combined with one in January before the Australian Open will mean too much tennis and too little rest.

Speaking at the Swiss Indoors tournament where he will play in Sunday's final against Romanian qualifier Marius Copil, the world number three said that given the impossibly short time frame to make a decision, he opted out of any commitment.

"I felt like the best weeks that I had to get to know players when I was playing were the Fed Cup weeks or the Olympic weeks, not necessarily during the tournaments.

Currently in ninth place, Nishikori with a win could move to within 125 points of the cut for the eight-man event in London next month.

He used his first break point to close out the first set before going up 3-0 in the second and wrapping up the win on his first match point.

The Spaniard broke Anderson twice in the second but didn't get another chance on the South African's serve in the final set.

"We also had the impression that at this stage it might be better to play matches than to train.

The competition is set to feature 18 countries in the November 18-24 finals in Madrid next year, and will replace

Download Resource
Subscribe!

the classic home-and-away ties played four times per year for decades.

Federer said earlier this month in Shanghai in that his chances of playing the Davis Cup were all but non-existent.

And there we go! An awesome, neat, concise, and useful summary for our articles.

What's Next?

Automatic Text Summarization is a hot topic of research, and in this article, we have covered just the tip of the iceberg. Going forward, we will explore the abstractive text summarization technique where deep learning plays a big role. In addition, we can also look into the following summarization tasks:

Problem-specific

- Multiple domain text summarization
- Single document summarization
- Cross-language text summarization (source in some language and summary in another language)

Algorithm-specific

- Text summarization using RNNs and LSTM
- Text summarization using Reinforcement Learning
- Text summarization using Generative Adversarial Networks (GANs)

End Notes

I hope this post helped you in understanding the concept of automatic text summarization. It has a variety of use cases and has spawned extremely successful applications. Whether it's for leveraging in your business, or just for your own knowledge, text summarization is an approach all NLP enthusiasts should be familiar with.

I will try to cover the abstractive text summarization technique using advanced techniques in a future article. Meanwhile, feel free to use the comments section below to let me know your thoughts or ask any questions you might have on this article.

Please find the code in this [GitHub Repo](https://github.com/prateekjoshi565/textrank_text_summarization) (https://github.com/prateekjoshi565/textrank_text_summarization).

**DAVID**[Reply](#)

November 2, 2018 at 7:35 am (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-155532>).

Hi Prateek,

Thanks for sharing. Since I'm an absolute beginner, hope you don't me asking. Why did I get this error & how do I fix this? Thanks.

```
NameError Traceback (most recent call last)
in ()
1 for s in df ['article_text']:
—> 2 sentences.append (sent_tokenize(s))
3 sentences = [y for x in sentences for y in x] #flatten list
```

NameError: name 'sentences' is not defined

November 2, 2018 at 10:56 am (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-155533>).

Hi David,

You seem to have missed executing the code 'sentences = []' just before the for loop.

**NADEESH**[Reply](#)

November 5, 2018 at 4:53 am (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-155556>).

@prateek It was a good article. I would like to point out a minor oversight.
Please add import of sent_tokenize into the corresponding section.
from nltk.tokenize import sent_tokenize

November 8, 2018 at 11:50 am (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-155627>).

Thank you Prateek. Learnt something new today.

I've attempted to answer the same using n-gram frequency for sentence weighting. The results differ a bit. Shorter sentences come thru textrank which does not in case of n-gram based.

It is here:

https://github.com/SanjayDatta/n_gram_Text_Summary/blob/master/A1.ipynb
(https://github.com/SanjayDatta/n_gram_Text_Summary/blob/master/A1.ipynb).

Would be happy to know your views.

Regards.

Hi,

I am not able to pass the initialization of the matrix, just at the end of Similarity Matrix Preparation. An IndexError: list index out of range.

Would you mind helping me with that?

**PRATEEK JOSHI**[Reply](#)

November 13, 2018 at 5:04 pm (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-155704>).

Hi,

Please make sure that the code

```
sim_mat[i][j] = cosine_similarity(sentence_vectors[i].reshape(1,100), sentence_vectors[j])
```

is written in one line.

Hey Prateek,

I tried your suggestion but I am still getting the error :(...I have a single line for `sim_mat[i][j]`. Is it possible that it is because of a mistake earlier in the code? I look for any issue, even checked your github...Is there anything else to try?

Hello Prateek,

I am getting below output at the very first step.

```
from nltk.tokenize import sent_tokenize
sentences = []
for s in df['article_text']:
    sentences.append(sent_tokenize(s))
sentences=[y for x in sentences for y in x]
```

```
sentences[:5]
['M', 'a', 'r', 'i', 'a']
```

Hi Arpit,

Please use indentation properly in your code.

Hi Prateek:

I just want to say Thank you!

Your article helps a lot for introduce me to the field of NLP.

But I just want to know the following code

```
sentence_vectors = []
for i in clean_sentences:
    if len(i) != 0:
        v = sum([word_embeddings.get(w, np.zeros((100,))) for w in i.split()]/(len(i.split())+0.001)
    else:
        v = np.zeros((100,))
    sentence_vectors.append(v)
```

and the step `w in i.split()` the `w` would be each character and not the word right?

Shouldn't we use the word and word similarity than the character and character similarity?

PRATEEK JOSHI

January 8, 2019 at 3:03 pm (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-156477>).

I am glad that you found my article helpful. The 'w' would be a word and not a character.

networkx dont have any funtion like "from_numpy_array" could you please recheck?

```
nx_graph = nx.from_numpy_array(sim_mat)
```

PRATEEK JOSHI

January 12, 2019 at 1:23 pm (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-156546>).

Hi,

"from_numpy_array" is a valid function. You can check this official documentation

https://networkx.github.io/documentation/stable/reference/generated/networkx.convert_matrix.from_numpy_array.html
(https://networkx.github.io/documentation/stable/reference/generated/networkx.convert_matrix.from_numpy_array.html)

March 2, 2019 at 6:45 am (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-157238>).

Is it from_numpy_matrix instead of from_numpy_array?

**PRATEEK JOSHI**[Reply](#)

March 3, 2019 at 5:30 pm (<https://www.analyticsvidhya.com/blog/2018/11/introduction-text-summarization-textrank-python/#comment-157251>).

It is from_numpy_array
